

# AIVAM

smart varnish technology

# About us....

In 2019 the idea was born to develop a smart paint to digitise the outer or inner shell (or a layer in between) of trailers or vehicles in a cost-efficient and easy manner.

AIVAM found a way to **detect**:

- Any kind of **damage to the surface**;
- **Changes in temperature**; or
- **Changes in moisture levels**

All achieved through a thin layer of AI - Varnish and technology linked to this.

Our AI - Varnish can be **applied to nearly every surface, object (or vehicle)**; in **urban** or **remote places**; and with the minimal power consumption, our solution can **provide updates to customers** whenever there is a customer requirement for an update.
